

Email Spam Classifier ##Problem Statement Spam emails disrupt communication and often contain harmful content or scams. Automating spam detection can reduce risks and improve user email experience by filtering unwanted messages effectively.

##Scope of the Project Load a real or synthetic email dataset for classification

Implement preprocessing of email text data to clean and standardize inputs

Prepare datasets split for machine learning workflows

Provide modular, documented Python code following good software practices

##Target Users Email service providers looking for improved spam filtering tools

Developers and researchers interested in email classification

Students learning machine learning applications in text processing

##High-Level Features Data input management and dataset exploration with meaningful statistics

Preprocessing pipeline from raw text cleaning to token filtering

Dataset splitting for training and evaluation

Clear logging and error handling mechanisms for robustness and maintainability
